

To the given problem faced by the cancer patient in the insurance process, we have come up with a solution of creating a portal between the hospital, patients and the insurance companies.

The patient can contact us for directly to start with the insurance procedure.

OUR OBJECTIVE

We are trying to help the patient suffering from RED ZONE DISEASES, to gain easy access to Insurance facilities.

Current Problems and Issues

There is a huge problem in India for patients admitted in hospitals to get easy access to Insurance facilities to facilitate the whole medical process.

Even after presence of large number of insurance companies, many people don't know how to get through the system.

PROPOSED SOLUTION

A centralised portal

Creating and Managing the Database

Collecting the data set and generating the report based upon:

Amount of Insurance required

Time frame provided by the patient

Database for the patients on basis of previous customer services by Insurance Companies

Classification of Diseases

Divide the diseases on the basis of their severity in three zones:

Low level

Mid Level

High level

Feed this data into the database for each patient

Funds Transfer with Secure Transaction system

Any secure transaction system fully encrypted between the clients.

Virtual money through Bitcoins or Google Wallet or any existing technology with which the client is comfortable.

Checklist for Pre-Requisites

Create a form or an application, which will include the list of all the pre-requisites, required by the insurance company such as various documents, ID proofs, etc.

BACKUP

In case the insurance is not sanctioned, for a given hospital/company/patient, we will create a list of various hospitals along with their treatment costs where the patient can get the treatment done at a cheaper price.
